

The Applekeys Package

Herb Schulz*

Let's test the **applekeys** package commands to see if it works correctly. This is a stretch of the command to find something in the Finder:

⌘ - ⇧ - ⇧ - ⌘ - → | - ← - ✎ - ⏏ - ⇧ - ⌘ - ⌘ - ⌘ - ⌘ - ⇧ - ^ - ⌘ - ⌘ - F.

and here is a list of the commands:

Key Name	Key Command	Result
Command	\cmdkey	⌘
Option	\optkey	⌘
Control	\ctlkey	^
Shift	\shiftkey	⇧
Delete	\delkey	⌘
Apple	\applekey	⌘
Open Apple	\openapplekey	⇧
Caps Lock	\capslockkey	⇧
Eject	\ejectkey	⏏
Pencil	\pencilkey	✎
Tab	\tabkey	→
Reverse Tab	\revtabkey	←
Escape	\esckey	⌘
Return	\returnkey	↵
Reverse Return	\revreturnkey	⇧ ↵
Power	\power	⌘

Since the Apple Keys are simply included graphics files they will work with any font you use. The sizes and vertical placement look fine *to my eyes* with the fonts I use; you are free to change them in the **applekeys.sty** package file but please don't ascribe the changes to me.

The Symbols were extracted from Apple fonts and converted into **.eps** format by Kino Quinon. They were then converted to **.pdf** by simply dropping them onto TeXShop. Both formats are included so that the symbols can

*E-mail: herbs2@mac.com. Symbols converted to **.eps** by Kino Quinon.

be used with `pdflatex` (which prefers the `.pdf` form) or `latex+ghostscript` (which prefers the `.eps` form) without change to the package file.
